Spring 2003

CS 5600

1

More Raster Line Issues

- Fat lines with multiple pixel width
- Symmetric lines
- End point geometry -- how should it look?
- Generating curves, e.g., circles, etc.
- Jaggies, staircase effect, aliasing...

Spring 2003

CS 5600

2

Generating Circles

Spring 2003

CS 5600

3

Exploit 8-Point Symmetry

Spring 2003

CS 5600

4

Once More: 8-Point Symmetry

Spring 2003

CS 5600

5

We Only Need to Generate One Octant

Spring 2003

CS 5600

6

Generating (x, y) gives

The following 8 points:

(x, y) , $(-x, y)$, $(-x, -y)$, $(x, -y)$,

(y, x) , $(-y, x)$, $(-y, -x)$, $(y, -x)$

Spring 2003

CS 5600

7

2nd Octant Is a Good Arc

- The arc is a *function* in this domain
 - single-valued
 - no vertical tangents
- $|slope| < 1$
- Lends itself to Bresenham
 - only need to consider E or SE

Spring 2003

CS 5600

8

Implicit Circle Equations

- Let $F(x, y) = x^2 + y^2 - r^2$
- For a circle $F(x, y) = 0$
- So $F(x, y) > 0 \Rightarrow$ *Outside*
- And $F(x, y) < 0 \Rightarrow$ *Inside*

Spring 2003

CS 5600

9

Decide Whether E or SE

- Function is $x^2 + y^2 - r^2 = 0$
- So $F(M) \geq 0 \Rightarrow$ SE
- And $F(M) < 0 \Rightarrow$ E

Spring 2003

CS 5600

10

$F(M) \geq 0 \Rightarrow SE$

Spring 2003

CS 5600

11

$F(M) < 0 \Rightarrow E$

Spring 2003

CS 5600

12

The Decision Variable d

Again we let,

$$d = F(M)$$

Spring 2003

CS 5600

13

Look at Case 1: E

Spring 2003

CS 5600

14

$$d_{old} < 0 \Rightarrow E$$

$$d_{old} = F(x_p + 1, y_p - \frac{1}{2})$$

$$= (x_p + 1)^2 + (y_p - \frac{1}{2})^2 - r^2$$

Spring 2003

CS 5600

15

$$d_{old} < 0 \Rightarrow E$$

$$d_{new} = F(x_p + 2, y_p - \frac{1}{2})$$

$$= (x_p + 2)^2 + (y_p - \frac{1}{2})^2 - r^2$$

Spring 2003

CS 5600

16

$$\underline{d_{old} < 0 \Rightarrow E}$$

$$d_{new} = d_{old} + (2x_p + 3)$$

Since,

$$\begin{aligned}(x_p + 2)^2 - (x_p + 1)^2 &= (4x_p + 4) - (2x_p + 1) \\ &= 2x_p + 3\end{aligned}$$

Spring 2003

CS 5600

17

$$\underline{d_{old} < 0 \Rightarrow E}$$

$$d_{new} = d_{old} + \Delta E,$$

$$\Delta E = 2x_p + 3$$

Spring 2003

CS 5600

18

Look at Case 2: SE

$$\underline{d_{old} \geq 0 \Rightarrow SE}$$

$$d_{new} = F(x_p + 2, y_p - \frac{3}{2})$$

$$= (x_p + 2)^2 + (y_p - \frac{3}{2})^2 - r^2$$

Spring 2003

CS 5600

19

Spring 2003

CS 5600

20

$$\underline{d_{old} \geq 0 \Rightarrow SE}$$

$$d_{new} = d_{old} + (2x_p - 2y_p + 5)$$

Because,...

Spring 2003

CS 5600

21

$$\underline{d_{old} \geq 0 \Rightarrow SE}$$

$$d_{new} - d_{old} =$$

$$(2x_p + 3) + (-3y_p + \frac{9}{4}) - (-y_p + \frac{1}{4})$$

From ΔE calculation From new y-coordinate From old y-coordinate

Spring 2003

CS 5600

22

$$\underline{d_{old} \geq 0 \Rightarrow SE}$$

That is,

$$d_{new} = d_{old} + (2x_p - 2y_p + 5)$$

Spring 2003

CS 5600

23

$$\underline{d_{old} \geq 0 \Rightarrow SE}$$

$$d_{new} = d_{old} + \Delta SE,$$

$$\Delta SE = 2x_p - 2y_p + 5$$

Spring 2003

CS 5600

24

Nonconstant $\Delta's$

There are dependencies on x_p and y_p
in computing Δ_E and Δ_{SE}

Spring 2003

CS 5600

25

Summary

- The only difference from the line algorithm is that point evaluations are needed for $\Delta's$
- Algorithm structure is exactly the same

Spring 2003

CS 5600

26

Initial Condition

- Let r be an integer. Start at $(0, r)$
 - Next midpoint lies at $(1, r - \frac{1}{2})$
 - So,
- $$F(1, r - \frac{1}{2}) = 1 + (r^2 - r - \frac{1}{4}) - r^2$$

$$= \frac{5}{4} - r$$

Spring 2003

CS 5600

27

Ellipses

- Evaluation is analogous
- Structure is same
- Have to work out the $\Delta's$

Spring 2003

CS 5600

28

Getting to Integers

- Note the previous algorithm involves *real* arithmetic
- Can we modify the algorithm to use integer arithmetic?

Spring 2003

CS 5600

29

Integer Circle Algorithm

- Define a shift decision variable

$$h = d - \frac{1}{4}$$

- In the code, plug in $d = h + \frac{1}{4}$

Spring 2003

CS 5600

30

Integer Circle Algorithm

- Now, the initialization is $h = 1 - r$
- So the initial value becomes

$$\begin{aligned} F(1, r - \frac{1}{2}) - \frac{1}{4} &= (\frac{5}{4} - r) - \frac{1}{4} \\ &= 1 - r \end{aligned}$$

Spring 2003

CS 5600

31

Integer Circle Algorithm

- Then, $d < 0$ becomes $h < \frac{1}{4}$
- Since h an integer

$$h < \frac{1}{4} \Leftrightarrow h < 0$$

Spring 2003

CS 5600

32

Integer Circle Algorithm

- But h begins as an integer
- And h gets incremented by integers
- Hence, we have an integer circle algorithm
- Sufficient to test for $h < 0$

Spring 2003

CS 5600

33

Integer Circle Algorithm

- But h begins as an integer
- And h gets incremented by integers
- Hence, we have an integer circle algorithm
- Sufficient to test for $h < 0$

Spring 2003

CS 5600

34

End of Bresenham Circles

Spring 2003

CS 5600

35

Another Digital Line Issue

- Clipping Bresenham lines
- The integer slope is not the true slope
- Have to be careful
- More issues to follow

Spring 2003

CS 5600

36

Line Clipping Problem

Spring 2003

CS 5600

37

Clipped Line

Spring 2003

CS 5600

38

Drawing Clipped Lines

Spring 2003

CS 5600

39

Clipped Line Has Different Slope !

Spring 2003

CS 5600

40

Pick Right Slope to Reproduce Original Line Segment

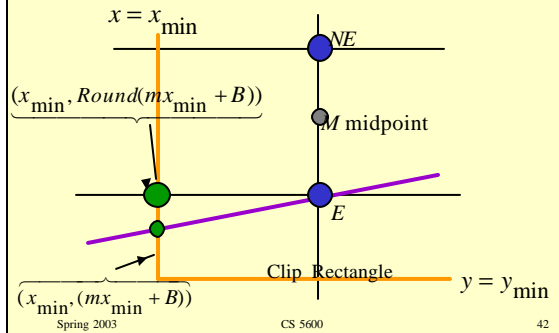

Zoom of previous situation

Spring 2003

CS 5600

41

Clipping Against $x = x_{\min}$

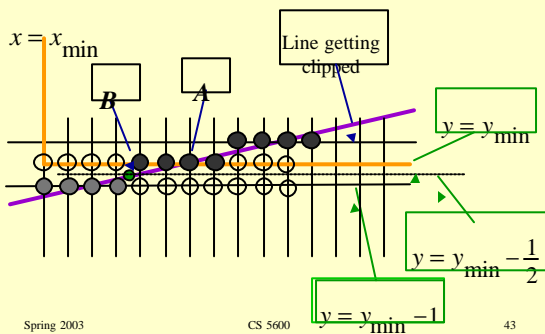

Spring 2003

CS 5600

42

Clipping Against $y = y_{\min}$

Spring 2003

CS 5600

43

Clipping Against $y = y_{\min}$

- Situation is complicated
- Multiple pixels involved at $(y = y_{\min})$
- Want all of those pixels as "in"
- Analytic \cap , rounding x gives A
- We want point B

Spring 2003

CS 5600

44

Clipping Against $y = y_{\min}$

- Use $\text{Line} \cap \left[y = y_{\min} - \frac{1}{2} \right]$
- Round *up* to nearest integer x
- This yields point B , the desired result

Spring 2003

CS 5600

45

Observations

- Lines are complicated
- Many aspects to consider
- We omitted many
- What about intensity of
 $y = x$ vs $y = 0$?

Spring 2003

CS 5600
